Frequently Asked Questions (FAQ)

Q1: What exactly is a thermoelectric generator (TEG)?

A1: A TEG is a device that converts heat energy directly into electrical energy using the Seebeck effect. This effect describes the creation of a voltage difference between two different conductors or semiconductors when a temperature difference exists between them. The TEG contains many thermocouples, which are pairs of dissimilar conductors, connected in series to increase the overall voltage output.

Q2: How efficient are TEGs in the ECT 100 Perpetuum Development Kit?

A2: The efficiency of TEGs is generally lower than other energy conversion methods like combustion or solar photovoltaics. The efficiency depends heavily on the materials used, the temperature difference across the module, and the design of the system. The ECT 100 Perpetuum Development Kit is primarily designed for educational purposes and demonstration, so its focus isn't on achieving maximum efficiency. However, users can experiment with different parameters to improve the power output and gain a deeper understanding of the factors affecting efficiency.
